DFU Thermography Screening Station: wiring schematic

Rev A · 2026-10-28 · Drawn from the station software: src/hardware/gpio.py, src/hardware/sht31.py, config/config.example.yaml (BCM numbering)

Notes

* Not recorded in the project. Confirm on the unit and write the values here: LED supply voltage, LED type, MOSFET part, gate, pull-down and status LED resistors.

All grounds are common. GPIO is 3.3 V: never connect the LED supply to a GPIO pin.

Pins can be changed in config/config.yaml (gpio: and ambient:). If they change, update this drawing.

The Lepton is the measurement camera; the colour camera and interior LED are for the colour frame only.

Wire colours on this drawing are for reading only.
